Introduction and aims

Legal and institutional structures

Results

Methods

Research into the impact of organ donation on healthcare professionals' experiences has been limited. This study aimed to explore the experiences of healthcare professionals in European countries in relation to organ donation. The study used a mixed-methods approach, combining qualitative and quantitative data. Results showed that healthcare professionals experienced both positive and negative impacts of organ donation. Positive impacts included increased awareness and knowledge, improved teamwork, and enhanced patient outcomes. Negative impacts included emotional distress, role ambiguity, and ethical dilemmas. The findings suggest that healthcare professionals' experiences of organ donation are complex and multifaceted. Further research is needed to better understand the implications of organ donation for healthcare professionals.
